## └ Introduction

### └ Where we're starting from

#### └ Where we're starting from

x

Where we're starting from

Figure 1: Two example HPC networks for the tutorial

You:

- ▶ have installed OpenHPC before
- ▶ have been issued a (basically) out-of-the-box OpenHPC cluster for this tutorial

Cluster details:

- ▶ Rocky Linux 9 (x86\_64)
- ▶ OpenHPC 3.1, Warewulf 3, Slurm 23.11.6
- ▶ 2 non-GPU nodes
- ▶ 2 GPU nodes (currently without GPU drivers, so: expensive non-GPU nodes)
- ▶ 1 management node (SMS)
- ▶ 1 unprovisioned login node

2024-07-13

# OpenHPC: Beyond the Install Guide

## └─ Introduction

### └─ Where we're starting from

#### └─ Where we're starting from

Where we're starting from

We used the OpenHPC automatic installation script from Appendix A with a few variations:

1. Installed `s-mail` to have a valid `MailProg` for `slurm.conf`.
2. Created `user1` and `user2` accounts with password-less `sudo` privileges.
3. Changed `CHROOT` from `/opt/ohpc/admin/images/rocky9.3` to `/opt/ohpc/admin/images/rocky9.4`.
4. Enabled `slurmd` and `nsight` in `CHROOT`.
5. Added `nano` and `yum` to `CHROOT`.
6. Removed a redundant `RuntimeToService` line from `/etc/slurm/slurm.conf`.
7. Stored all compute/GPU nodes' SSH host keys in `/etc/ssh/ssh_known_hosts`.
8. Globally set an environment variable `CHROOT` to `/opt/ohpc/admin/images/rocky9.4`.

x

2024-07-13

# OpenHPC: Beyond the Install Guide

└─ Introduction

└─ Where we're going

└─ Where we're going

Where we're going

1. A login node that's practically identical to a compute node (except for where it needs to be different)
2. A slightly more secured SMS and login node
3. GPU drivers on the GPU nodes
4. Using node-local storage for the OS and/or scratch
5. De-coupling the SMS and the compute nodes (e.g., independent kernel versions)
6. Easier management of node differences (GPU or not, diskless/single-disk/multi-disk, Infiniband or not, etc.)
7. Slurm configuration to match some common policy goals (fair share, resource limits, etc.)

x

2024-07-13

# OpenHPC: Beyond the Install Guide

└─ Making better infrastructure nodes

└─ A dedicated login node

└─ Assumptions

## Assumptions

1. We have a VM named `login`, with no operating system installed.
2. The `eth0` network interface for `login` is attached to the internal network, and `eth1` is attached to the external network.
3. The `eth0` MAC address for `login` is known—check the **Login server** section of your handout for that. It's of the format `aa:bb:cc:dd:ee:ff`.
4. We're logged into the SMS as `user1` or `user2` that has `sudo` privileges.

x

2024-07-13

# OpenHPC: Beyond the Install Guide

- └─ Making better infrastructure nodes

- └─ A dedicated login node

- └─ Create a new login node

x

Create a new login node

Working from section 3.9.3 of the install guide:

```
[user@node ~]$ sudo wush -y node new login --netdev eth0 \
--ipaddr=172.16.0.2 --hwaddr=__:__:__:__:__:__
[user@node ~]$ sudo wush -y provision set login \
--node=rocky.4 --bootstrap=$(uname -r) \
--files=dynamic_hosts,passwords,group,shadow,munge.key,network
```

Make sure to replace the \_\_ with the characters from your login node's MAC address!

3. Save and exit nano by pressing `Ctrl-X` and then `Enter`.
4. Reload the new Slurm configuration everywhere (well, everywhere functional) with `sudo scontrol reconfigure` on the SMS.

2024-07-13

# OpenHPC: Beyond the Install Guide

└─ Making better infrastructure nodes

└─ A dedicated login node

└─ Option 1: take the error message literally

x

Option 1: take the error message literally

So there's no entry for login in the SMS `slurm.conf`. To fix that:

1. Run `slnrmd -C` on the login node to capture its correct CPU specifications. Copy that line to your laptop's clipboard.
2. On the SMS, run `nano /etc/slurm/slurm/slurm.conf` and make a new line of all the `slurm -C` output from the previous step (pasted from your laptop clipboard).
3. Save and exit nano by pressing `Ctrl-X` and then `Enter`.
4. Reload the new Slurm configuration everywhere (well, everywhere functional) with `sudo scontrol reconfigure` on the SMS.
5. `ssh` back to the login node and restart `slurmd`, since it wasn't able to respond to the `scontrol reconfigure` from the previous step (`sudo ssh login ssystemctl restart slurmd` on the SMS).

2024-07-13

# OpenHPC: Beyond the Install Guide

- └─ Making better infrastructure nodes
  - └─ A dedicated login node
    - └─ Option 1: take the error message literally

x

Option 1: take the error message literally

Now an `sinfo` should work on the login node:

```
[root@login ~]# sinfo
PARTITION AVAIL  TIMELIMIT  NODES  STATE NODELIST
normal*    up 1:00:00:00      1  idle c[1-2]
```

2024-07-13

## OpenHPC: Beyond the Install Guide

- └─ Making better infrastructure nodes

- └─ A dedicated login node

- └─ Option 2: why are we running slurmd anyway?

x

Option 2: why are we running `slurmd` anyway?

The `slurmd` service is really only needed on systems that will be running computational jobs, and the login node is not in that category.

Running `slurmd` like the other nodes means the login node can get all its information from the SMS, but we can do the same thing with a very short customized `slurm.conf` with two lines from the SMS' `slurm.conf`:

```
ClusterName=cluster  
SlurmctldHost=sms
```

2024-07-13

# OpenHPC: Beyond the Install Guide

- └─ Making better infrastructure nodes
  - └─ A dedicated login node
    - └─ Interactive test

x

Interactive test

1. On the login node as root, temporarily stop the slurm service with `systemctl stop slurm`
2. On the login node as root, edit `/etc/slurm/slurm.conf` with `nano /etc/slurm/slurm.conf`
3. Add the two lines to the right, save and exit `nano` by pressing `Ctrl-X` and then `Enter`.

Verify that `sinfo` still works without `slurm` and with the custom `/etc/slurm/slurm.conf`.

```
[root@login ~]# sinfo
PARTITION AVAIL  TIMELIMIT  NODES  STATE NODELIST
normal*    up   1:00:00:00      1  idle c[1-2]
```

`/etc/slurm/slurm.conf` on login node

```
ClusterName=cluster
SlurmctldHost=ans
```

2024-07-13

# OpenHPC: Beyond the Install Guide

- └─ Making better infrastructure nodes

- └─ A dedicated login node

- └─ Make permanent changes from the SMS

Make permanent changes from the SMS

Let's reproduce the changes we made interactively on the login node in the Warewulf settings on the SMS.

For the customized `slurm.conf` file, we can keep a copy of it on the SMS and add it to the Warewulf file store.

We've done that previously for files like the shared `munge.key` for all cluster nodes (see section 3.8.5 of the OpenHPC install guide).

We also need to make sure that file is part of the login node's provisioning settings.

x

2024-07-13

# OpenHPC: Beyond the Install Guide

- └─ Making better infrastructure nodes

- └─ A dedicated login node

- └─ Make permanent changes from the SMS

Make permanent changes from the SMS

On the SMS:

```
[user@sms ~]$ sudo scp login:/etc/slurm/slurm.conf \
/etc/slurm/slurm.conf.login
slurm.conf                                100% 40    87.7KB/s   00:00
[user@sms ~]$ sudo wush -y file import \
/etc/slurm/slurm.conf.login --name=slurm.conf.login \
--path=/etc/slurm/slurm.conf
```

Now the file is available, but we need to ensure the login node gets it. That's handled with wush provision.

x

2024-07-13

# OpenHPC: Beyond the Install Guide

- └─ Making better infrastructure nodes
  - └─ A dedicated login node
    - └─ A quick look at wush provision

x

A quick look at wush provision

What are the provisioning settings for compute node c1?

```
[userid@ ~]$ wush provision print c1
#### c1 #####
ci: MASTER           = UNDEF
ci: BOOTSTRAP        = c1.96-1.el9.elrepo.x86_64
ci: VMFS              = rocky9.4
ci: VALIDATE         = FALSE
ci: FILES            = dynamic_hosts.group.munge.key.network,
                        passwd.shadow
...
ci: KARGS             = "net.ifnames=0 biosdevname=0 quiet"
ci: BOOTLOCAL        = FALSE
```

2024-07-13

- └─ Making better infrastructure nodes
  - └─ A dedicated login node
    - └─ A quick look at wsh provision

x

A quick look at wsh provision

What are the provisioning settings for node login?

```
[userid@node ~]$ wsh provision print login
### login #####
login: MASTER      = UNDEF
login: BOOTSTRAP    = 0.1.50-1.el9.elrepo.x86_64
login: VMSF         = rocky9.4
login: VALIDATE     = FALSE
login: FILES        = dynamic_hosts,group,munge.key,network,
                    passwd,shadow
...
login: XARGS        = "set.ifnames=0 biosdevname=0 quiet"
login: BOOTLOCAL    = FALSE
```

2024-07-13

# OpenHPC: Beyond the Install Guide

- └─ Making better infrastructure nodes
  - └─ A dedicated login node
    - └─ A quick look at `wwsh` provision

x

A quick look at `wwsh` provision

The provisioning settings for `c1` and `login` are identical, but there's a lot to read in there to be certain about it.

We could run the two outputs through `diff`, but every line contains the node name, so **no lines are literally identical**.

Let's simplify and filter the `wwsh` provision output to make it easier to compare.

2024-07-13

## OpenHPC: Beyond the Install Guide

- └─ Making better infrastructure nodes

- └─ A dedicated login node

- └─ Filter the `wwsh provision` output

Filter the `wwsh provision` output

► I only care about the lines containing `= signs`, so

```
wwsh provision print cl | grep "="
```

is a start.

x

2024-07-13

# OpenHPC: Beyond the Install Guide

└─ Making better infrastructure nodes

└─ A dedicated login node

└─ Filter the `wwsh provision` output

x

Filter the `wwsh provision` output

► I only care about the lines containing `= signs`, so

```
wwsh provision print cl | grep "="
```

is a start.

► Now all the lines are prefixed with `cl::`, and I want to keep everything after that, so

```
wwsh provision print cl | grep "=" | cut -d: -f2-
```

will take care of that.

2024-07-13

# OpenHPC: Beyond the Install Guide

└─ Making better infrastructure nodes

└─ A dedicated login node

└─ Filtered result

Filtered result

```
vvah provision print cl | grep = | cut -d: -f2-  
MASTER          = UNDEF  
BOOTSTRAP        = 6.1.06-1.el9.elrepo.x86_64  
YNFS              = rocky9-4  
VALIDATE         = FALSE  
FILES            = dynamic_hosts.group.manage.key.network,  
                  passwd,shadow  
...  
KARGES           = "net.ifnames=0 biosdevname=0 quiet"  
BOOTLOCAL        = FALSE
```

Much more useful.

x

2024-07-13

# OpenHPC: Beyond the Install Guide

- └─ Making better infrastructure nodes
  - └─ A dedicated login node
    - └─ Make a function for this

x

Make a function for this

We may be typing that command pipeline a lot, so let's make a shell function to cut down on typing:

```
[user@node ~]$ function pprint() { \
  vssh provision print $@ | grep - | cut -d: -f2- ; }
[user@node ~]$ pprint cl
MASTER           = UNDEF
BOOTSTRAP         = 6.1.96-1.el9.elrepo.s86_64
...

```

2024-07-13

# OpenHPC: Beyond the Install Guide

- └─ Making better infrastructure nodes

- └─ A dedicated login node

- └─ diff the outputs

x

diff the outputs

We could redirect a `proprint c1` and a `proprint login` to files and `diff` the resulting files, or we can use the shell's `<()` operator to treat command output as a file:

```
[user@node ~]$ diff -u <($(proprint c1)) <($(proprint login))  
[user@node ~]$
```

Either of those shows there are zero provisioning differences between a compute node and the login node.

2024-07-13

## OpenHPC: Beyond the Install Guide

- └─ Making better infrastructure nodes

- └─ A dedicated login node

- └─ Add the custom `slurm.conf` to the login node

Add the custom `slurm.conf` to the login node

Add a file to login's `FILES` property with:

```
[user@node ~]$ sudo bash -y provision set login \
--fileadd=slurm.conf.login
```

(refer to section 3.9.3 of the install guide for previous examples of `--fileadd`).

x

2024-07-13

# OpenHPC: Beyond the Install Guide

- └─ Making better infrastructure nodes
  - └─ A dedicated login node
    - └─ Check for provisioning differences

Check for provisioning differences

```

# OpenHPC: Beyond the Install Guide

- └─ Making better infrastructure nodes

- └─ A dedicated login node

- └─ Ensure slurmd doesn't run on the login node

x

Ensure `slurmd` doesn't run on the login node

To disable the `slurmd` service on just the login node, we can take advantage of conditions in the `systemd` service file. Back on the login node as root:

```
[user@node ~]$ sudo ssh login
[root@login ~]# systemctl edit slurmd
```

Insert these lines between the lines of `## Anything between here... and`  
`## Lines below this comment...!`

```
[Unit]
ConditionHost=!c*
ConditionHost=!g*
```

This will only run the service on nodes whose hostnames start with `c` or `g`.

2024-07-13

# OpenHPC: Beyond the Install Guide

- └─ Making better infrastructure nodes

- └─ A dedicated login node

- └─ Ensure slurmd doesn't run on the login node

x

Ensure slurmd doesn't run on the login node

Once that file is saved, try to start the slurmd service with `systemctl start slurmd` and check its status with `systemctl status slurmd`.

```
s slurmd.service - Slurm node daemon
..
Condition: start condition failed at Sat 2024-07-06 18:12:17
EDT; 4min 22s ago
..
Jul 06 17:14:16 login systemd[1]: Stopped Slurm node daemon.
Jul 06 18:12:17 login systemd[1]: Slurm node daemon was skipped
because of an unset condition check (ConditionNot=c*).
```

# OpenHPC: Beyond the Install Guide

- └─ Making better infrastructure nodes
  - └─ A dedicated login node
    - └─ Make the changes permanent

x

[Make the changes permanent](#)

The `systemctl edit` command resulted in a file  
`/etc/systemd/system/slurmd.service.d/override.conf`. Let's:

- ▶ make a place for it in the cheat on the SMS, and
- ▶ copy the file over from the login node.

```
[user@lana ~]$ sudo mkdir -p \
$(CHROOT)/etc/systemd/system/slurmd.service.d/
[user@lana ~]$ sudo scp \
login:/etc/systemd/system/slurmd.service.d/
$(CHROOT)/etc/systemd/system/slurmd.service.d/
override.conf 100% 23 36.7KB/s 00:00
```

(Note: we globally pre-set the `CHROOT` environment for any account that logs into the SMS so that you didn't have to.)

2024-07-13

Problem: the login node doesn't let users log in

What if we ssh to the login node as someone other than root?

```
[user@node ~]$ ssh login
Access denied: user user1 (uid=1001) has no active jobs on this
node.
Connection closed by 172.16.0.2 port 22
```

which makes this the exact opposite of a login node for normal users. Let's fix that.

2024-07-13

# OpenHPC: Beyond the Install Guide

- └─ Making better infrastructure nodes

- └─ A dedicated login node

- └─ Make the login node function as a login node

x

Make the login node function as a login node

- ▶ The Access denied is caused by the `pan_sshd.no` entry at the end of `/etc/pan.d/ssh`, which is invaluable on a normal compute node, but not on a login node.
- ▶ On the SMS, you can also do a `diff -u /etc/pan.d/ssh $(CWDOT)/etc/pan.d/ssh`
- ▶ You'll see that the `pan_sshd.no` line is the only difference between the two files.

2024-07-13

# OpenHPC: Beyond the Install Guide

└─ Making better infrastructure nodes

└─ A dedicated login node

└─ Test a PAM change to the login node

Test a PAM change to the login node

- ▶ Temporarily comment out the last line of the login node's `/etc/pam.d/ssh` and see if you can ssh into the login node as a normal user (i.e., `ssh user1@login`).
- ▶ Your user should be able to log in now.
- ▶ In case the PAM configuration won't let root log in, **don't panic!** Instructors can reboot your login node from its console to put it back to its original state.

x

2024-07-13

# OpenHPC: Beyond the Install Guide

# OpenHPC: Beyond the Install Guide

- └─ Making better infrastructure nodes
  - └─ A bit more security for the login node
    - └─ A bit more security for the login node

A bit more security for the login node

Not too long after your SMS and/or login nodes are booted, you'll see messages in the SMS /var/log/secure like:

```
Jul 11 11:24:08 sms sshd[162636]: Invalid user evilmike from
68.66.205.120 port 1028
...
Jul 11 11:24:08 sms sshd[162636]: Failed password for invalid
user evilmike from 68.66.205.120 port 1028 ssh2
...
```

because people who want to break into computers for various reasons have Internet connections.

x

# OpenHPC: Beyond the Install Guide

└─ Making better infrastructure nodes

└─ A bit more security for the login node

└─ A bit more security for the login node

x

A bit more security for the login node

There's a lot of things that can be done to secure things, including:

1. Placing the SMS and login node external interfaces on protected network segment.
2. Allowing only administrative users to SSH into the SMS.
3. Replacing password-based authentication with key-based authentication.

Though #3 will eliminate brute-force password guessing attacks, it's usually not practical for a login node. So let's mitigate that differently with `fail2ban`.

2024-07-13

# OpenHPC: Beyond the Install Guide

- └─ Making better infrastructure nodes
  - └─ A bit more security for the login node
    - └─ How fail2ban works (by default)

How fail2ban works (by default)

1. Monitor `/var/log/secure` and other logs for indicators of brute-force attacks (invalid users, failed passwords, etc.)
2. If indicators from a specific IP address happen often enough over a period of time, use `firewalld` to block all access from that address for a period of time.
3. Once that period has expired, remove the IP address from the block list.

This reduces the effectiveness of brute-force password guessing by orders of magnitude (~10 guesses per hour versus ~100 or ~1000 guesses per hour).

Including `firewalld` could mean that some necessary services get blocked by default when `firewalld` starts. Let's see what those could be.

x

2024-07-13

# OpenHPC: Beyond the Install Guide

└─ Making better infrastructure nodes

└─ A bit more security for the login node

└─ See what processes are listening on the login node

See what processes are listening on the login node

We'll use the `netstat` command to look for sockets that are udp or tcp, listening, and what process the socket is attached to. We omit anything only listening for localhost connections.

```
[user@lerna ~]$ sudo ssh login netstat -tulnp | grep -v localhost
Active Internet connections (only servers)
Proto ... Local Address ... State PID/Program name
tcp      0.0.0.0:ssh      LISTEN 1034/sshd: /usr/abi
tcp      0.0.0.0:swarp    LISTEN 1/init
tcp6     [::]:ssh        LISTEN 1034/sshd: /usr/abi
tcp6     [::]:swarp      LISTEN 1/init
udp      0.0.0.0:swarp    0.0.0.0:* 1/init
udp      0.0.0.0:37036    0.0.0.0:* 1143/rpylogd
udp6     [::]:swarp      [::]:* 1/init
```

x

2024-07-13

# OpenHPC: Beyond the Install Guide

- └─ Making better infrastructure nodes

- └─ A bit more security for the login node

- └─ See what processes are listening on the login node

x

See what processes are listening on the login node

`sshd` secure shell daemon, the main thing we want to protect against brute force attempts

`init` the first process started during booting the operating system. Effectively, this shows up when you participate in NFS file storage, as a server or a client (and login is a client).

`rsyslogd` message logging for all kinds of applications and services

Of these, `sshd` is the only one that we need to ensure `firewalld` doesn't block by default. In practice, the `ssh` port (22) is always in the default list of allowed ports.

2024-07-13

# OpenHPC: Beyond the Install Guide

- └─ Making better infrastructure nodes
  - └─ A bit more security for the login node
    - └─ Test installing fail2ban on the login node

x

Test installing fail2ban on the login node

Install the fail2ban packages into the CHROOT with

```
[user@hpc ~]$ sudo yum install --installroot=${CHROOT} \
fail2ban
[user@hpc ~]$ sudo chroot ${CHROOT} systemctl enable \
fail2ban firewalld
```

(the yum command will also install firewalld as a dependency of fail2ban).

Add the following to the chroot's sashd.local file with  
sudo nano \${CHROOT}/etc/fail2ban/jail.d/sashd.local:

```
[sashd]
enabled = true
```

2024-07-13

## OpenHPC: Beyond the Install Guide

└─ Making better infrastructure nodes

└─ A bit more security for the login node

└─ Should I run `fail2ban` everywhere?

x

Should I run `fail2ban` everywhere?

`fail2ban` is probably best to keep to the login node, and not the compute nodes:

- ▶ Nobody can SSH into your compute nodes from outside.
- ▶ Thus, the only things a compute node could ban would be your SMS or your login node.
- ▶ A malicious or unwitting user could easily ban your login node from a compute node by SSH'ing to it repeatedly, which would effectively be a denial of service.

2024-07-13

## OpenHPC: Beyond the Install Guide

- └─ Making better infrastructure nodes
  - └─ A bit more security for the login node
    - └─ Test installing fail2ban on the login node

Test installing fail2ban on the login node

```
[user@node ~]$ sudo mkdir -p \
${CHROOT}/etc/systemd/system/fail2ban.service.d/ \
${CHROOT}/etc/systemd/system/firewalld.service.d/
```

x

- └─ Making better infrastructure nodes
  - └─ A bit more security for the login node
    - └─ Test installing fail2ban on the login node

x

Test installing fail2ban on the login node

Before we go further, check if there's anything in `/var/log/secure` on the login node:

```
[User@node ~]$ sudo cat login |> /var/log/secure
-rw-r----- 1 root root 0 Jul 7 03:14 /var/log/secure
```

Nope. Let's fix that, too.

- Looking in `/etc/rsyslog.conf`, we see a bunch of things commented out, including the line `#authpriv.* /var/log/secure`.
- Rather than drop in an entirely new `rsyslog.conf` file that we'd have to maintain, `rsyslog` will automatically include any `*.conf` files in `/etc/rsyslog.d`.
- Let's make one of those for the chroot.

2024-07-13

## OpenHPC: Beyond the Install Guide

x

Diagnosing 3/NOTIMPLEMENTED

Let's re-run the wubootstrap command and reboot the login node:

```
[user@hans ~]$ sudo wubootstrap $(uname -r)
...
Bootstrap image '6.1.97-1.el9.elrepo.x86_64' is ready
Done.
[user@hans ~]$ sudo xsh login reboot
```

2024-07-13

## OpenHPC: Beyond the Install Guide

- └─ Making better infrastructure nodes
  - └─ A bit more security for the login node
    - └─ Does fail2ban actually work now?

x

Does fail2ban actually work now?

```
[user@hpc ~]$ sudo ssh login grep 68.66.205.120 \  
/var/log/fail2ban.log  
...  
2024-07-11 22:02:27,030 fail2ban.actions ... [sshd] Ban \  
68.66.205.120
```

It does.

2024-07-13

# OpenHPC: Beyond the Install Guide

- └─ Making better infrastructure nodes

- └─ A bit more security for the login node

- └─ What does it look like from evilmike's side?

x

What does it look like from evilmike's side?

```
mike@server:~$ ssh evilmike@149.165.155.235
evilmike@149.165.155.235's password:
Permission denied, please try again.
evilmike@149.165.155.235's password:
Permission denied, please try again.
evilmike@149.165.155.235's password:
evilmike@149.165.155.235: Permission denied (publickey,
gssapi-keyex,gssapi-with-mic,password).
mike@server:~$ ssh evilmike@149.165.155.235
ssh: connect to host 149.165.155.235 port 22: Connection
refused
```

evilmike is thwarted, at least for now.

# OpenHPC: Beyond the Install Guide

- └─ Making better compute nodes

- └─ More seamless reboots of compute nodes

- └─ Why was c1 marked as down?

x

Why was c1 marked as down?

You can return c1 to an idle state by running  
`sudo scontrol update node=c1 state=resume` on the SMS:

```
[user@hpc ~]$ sudo scontrol update node=c1 state=resume
[user@hpc ~]$ sinfo
PARTITION AVAIL  TIMELIMIT  NODES  STATE NODELIST
normal*   up    1-00:00:00      1    idle c[1-2]
```

We should configure things so that we don't have to manually resume nodes every time we reboot them.

2024-07-13

# OpenHPC: Beyond the Install Guide

- └─ Making better compute nodes

- └─ More seamless reboots of compute nodes

- └─ More seamless reboots of compute nodes

More seamless reboots of compute nodes

- ▶ Slurm doesn't like it when a node gets rebooted without its knowledge.
- ▶ There's an `scontrol reboot` option that's handy to have nodes reboot when system updates occur, but it requires a valid setting for `RebootProgram` in `/etc/slurm/slurm.conf`.
- ▶ By default, Slurm and OpenHPC don't ship with a default `RebootProgram`, so let's make one.

x

2024-07-13

# OpenHPC: Beyond the Install Guide

- └─ Making better compute nodes
  - └─ More seamless reboots of compute nodes
    - └─ Adding a valid RebootProgram

x

Adding a valid RebootProgram

```
[user@node ~]$ grep -i reboot /etc/slurm/slurm.conf
#RebootProgram=""
[user@node ~]$ echo 'RebootProgram="/sbin/shutdown -r now"' \
| sudo tee -a /etc/slurm/slurm.conf
[user@node ~]$ grep -i reboot /etc/slurm/slurm.conf
#RebootProgram=""
RebootProgram="/sbin/shutdown -r now"
```

2024-07-13

# OpenHPC: Beyond the Install Guide

└─ Making better compute nodes

└─ More seamless reboots of compute nodes

└─ Informing all nodes of the changes and testing it out

x

Informing all nodes of the changes and testing it out

```
[user@node ~]$ sudo scontrol reconfigure  
[user@node ~]$ sudo scontrol reboot ASAP sxtatstate=RESUME c1
```

- ▶ scontrol reboot will wait for all jobs on a group of nodes to finish before rebooting the nodes.
- ▶ scontrol reboot ASAP will immediately put the nodes in a DRAIN state, routing all pending jobs to other nodes until the rebooted nodes are returned to service.
- ▶ scontrol reboot ASAP sxtatstate=RESUME will set the nodes to accept jobs after the reboot. sxtatstate=DRAIN will leave the nodes in a DRAIN state if you need to do more work on them before returning them to service.

# OpenHPC: Beyond the Install Guide

- └─ Making better compute nodes
  - └─ More seamless reboots of compute nodes
    - └─ Did it work?

x

Did it work?

```
[user@node ~]$ sudo ash ci uptime
15:52:27 up 1 min, 0 users, load average: 0.09, 0.06, 0.02
[user@node ~]$ sinfo
PARTITION AVAIL TIMELIMIT NODES STATE NODELIST
normal*   up 1-00:00:00    1 idle c[1-2]
```

2024-07-13

# OpenHPC: Beyond the Install Guide

└─ Making better compute nodes

└─ Decoupling kernels from the SMS

└─ Decoupling kernels from the SMS

Decoupling kernels from the SMS

- ▶ If you keep your HPC around for a long period, you might want/need to support different operating systems or releases.
- ▶ Maybe you need to run a few nodes on Rocky 8 while keeping the SMS on Rocky 9 (snkchroot supports that).
- ▶ Maybe you need to use a different kernel version for exotic hardware or new features, but don't want to risk the stability of your SMS.
- ▶ A simple `snkchroot` won't do that.

x

# OpenHPC: Beyond the Install Guide

└─ Making better compute nodes

└─ Decoupling kernels from the SMS

└─ Decoupling kernels from the SMS

Decoupling kernels from the SMS

Check wbootstrap --help:

```
[user@node ~]$ wbootstrap --help
USAGE: /usr/bin/wbootstrap [options] kernel_version
...
  OPTIONS:
    -C, --chroot    Look into this chroot directory to find
                    the kernel
...

```

So if we install a kernel into the `$(CHROOT)` like any other package, we can bootstrap from it instead of the SMS kernel.

x

## └─ Configuring Slurm policies

### └─ Sample slide

This is my note.

- It can contain Markdown
- like this list

#### Left column

This slide has two columns. They don't always have to have columns. It also has a titled block of content in the left column. Make sure you've always got a `::: notes` block after the slide content, even if it has no content.

Use `#` and `##` headers in the Markdown file to make level-1 and level-2 headings. `###` headers to make slide titles, and `####` to make block titles.
